

The two outer islands are a fourth of a mile apart, and lie NW & SE of each other and [are] connected by a rocky bar. The southern island is about 20 yards in diameter, the northern one a fourth of a mile long, each of them about 20 feet in height above the sea, no trees on either of them. The southern point extends off and shows a breaker an eighth of a mile in rough weather, and from off the N.E. point of the large island there is a rock at a cable's length distance with 5 feet on it, bearing NNE from the north point.

The inner Green Island lies NE from the other two, 1 ½ miles distance. This is a small low island without trees, and on every side except the NW surrounded with rocky points & reefs. From its SW end there is a reef running SW towards the other Green Islands, ¾ of a mile in length, which generally shows itself at low water. Between the SW end of this reef & the Great Green Island is a passage of a fourth of a mile or more in width, having 5 fathoms water.

Between the inner Green Island and the S.W. point of Jewell's Island there is also a passage, having 5 fathoms water, but [it] is narrow and ought not to be attempted by a stranger, as the rocky points from these two islands quite interlock each other.
